SUMMARY

Senior Backend Engineer with 8+ years in Node.js and TypeScript. Led backend development for SwagUp's multi-tenant B2B marketplace — redesigned order-to-invoice billing to eliminate recurring margin loss, and cut API response times from ~4s to 300–500ms. Built event-driven integrations on AWS, payment and subscription flows, and an LLM tool-calling agent for packaging selection. Earlier built real-time features for a fantasy sports platform with 3M+ registered users, and backend services for Singapore's citizen health app with ~900K monthly active users.

SKILLS

Languages & Frameworks	Node.js, TypeScript, Express, NestJS, REST APIs, GraphQL
Databases & Caching	PostgreSQL, MongoDB, Redis, Elasticsearch
Architecture & Design	Microservices, event-driven systems, pub/sub, multi-tenant design, CQRS, idempotency, cache-aside caching
Cloud & DevOps	AWS (Lambda, API Gateway, SQS, SNS, S3, EC2, ECS, CloudWatch), Docker, Kubernetes, CI/CD, Sentry
Domain	Payments, subscriptions, wallets, webhooks
AI & LLM Integration	LLM APIs, tool calling

EXPERIENCE

Lead Software Engineer — SwagUp

Mar 2023 – Apr 2026

Led backend engineering for SwagUp's multi-tenant B2B marketplace for corporate merchandise, custom branding, and global fulfillment, served through GraphQL and REST APIs.

- Redesigned the order-to-invoice workflow to eliminate recurring margin losses caused by vendor price increases after order placement, replacing single upfront invoicing with staged deposits and purchase-order-based billing.
- Reduced product-listing API response times from ~4s to 300–500ms by correcting MongoDB aggregation-stage ordering, adding a missing compound index, and introducing Redis cache-aside caching with TTLs.
- Improved B2B product discovery and repeat ordering by implementing Elasticsearch relevance boosting across product name, brand, category, and description, plus editable occasion-based packs and shareable cart IDs that let regional accounts reuse finalized configurations.
- Built an LLM-powered tool-calling agent that selects custom packaging based on product dimensions, weight, and type, reducing recurring costs from incorrectly sized boxes at scale.
- Removed reliance on daily cron syncs for price-sensitive Elasticsearch data by extending the SNS/SQS event pipeline to update the Kubernetes-hosted CQRS search read model in near real time, with priority alerts for failed price-sensitive updates.
- Stabilized bulk processing of 20K–40K hierarchical Salesforce product records after synchronous syncs crashed the application, building an asynchronous job scheduler and Node.js worker-thread pipeline with SKU-based upserts to avoid duplicates and downtime.
- Replaced fragile synchronous Salesforce synchronization with an SNS/SQS and Lambda-based pub/sub pipeline, adding per-subscriber webhook URLs and authentication, retry policies, dead-letter queues (DLQs), and admin tools to diagnose and reprocess failed records without manual log tracing.
- Built subscription-based membership tiers with tiered discounts and warehouse-storage benefits; implemented a PostgreSQL-backed customer wallet for payments and automatic refund credits, using Redis idempotency keys to prevent duplicate charges across payment and order flows.
- Established engineering practices for a growing team: introduced a Git branching strategy that let two teams ship independently from a shared repository without cherry-picks, and re-established Confluence documentation, API contracts, architecture docs, and RFC-style reviews as references for onboarding new engineers.
- Operated Dockerized microservices on AWS EC2 and ECS behind API Gateway, with a centralized Lambda authorizer for authentication and authorization, CI/CD-driven deployments, and CloudWatch and Sentry monitoring.

Senior Software Engineer — CoffeeBeans Consulting

Jun 2021 – Mar 2023

- Took sole ownership of PropSoch, a property-listing platform, after scope changes reduced the team — built Google Sign-In and Google Maps-based location search with proximity filtering and nearby-amenity highlighting.
- Built a custom admin portal with browser-level persistence for partially completed multi-step property forms, cutting data-entry abandonment and helping onboard 10–15k property listings.
- Led a 3-engineer team building Open edX integrations and automated data-sync workflows on PostgreSQL, plus CCAvenue payment integration and a reward wallet crediting farmers for completing courses, for Salam Kisan, an agricultural platform that has since scaled to 550,000+ farmers across India.
- Delivered backend services for Healthy 365, a Singapore government citizen health app with ~900K monthly active users, within a strict CI/CD pipeline with 90% minimum unit-test coverage gates across Dev, QA, Staging, UAT, and Pre-prod environments, with Sentry-based error monitoring.

Software Engineer — Yudiz Solutions, on 11Wickets

May 2020 – May 2021

11Wickets is a fantasy sports platform competing directly with Dream11, with 3M+ registered users.

- Refactored the legacy React codebase from class components to hooks, using React.memo, useMemo, and react-window virtualization to fix UI lag on live-score screens during peak match traffic, and cut initial bundle size through lazy loading and code splitting.
- Converted the web app into a PWA with custom service workers for offline caching, raising Lighthouse performance scores from ~60 to 90+ and driving a company-recognized jump in web engagement during live matches.
- Built real-time chat and unified live-score delivery across web, iOS, and Android on a single WebSocket and Redis-based backend, replacing a third-party live-score service.

Software Engineer — Biztech, on BrushYourIdeas

Jan 2019 – Mar 2020

- Proposed and led a modular rewrite of an aging Angular codebase, replacing manual per-order bundle creation with automated module-based packaging across Professional, Ultimate, and Custom tiers; validated the new Custom tier through full combinatorial sandbox testing before launch. The product later rebranded as PrintXpand, now serving 350+ print businesses across 40+ countries.

Junior Software Engineer — Angular Minds, on Numnu

Dec 2017 – Sep 2018

- Contributed to frontend and backend feature development in an early-stage product environment, building foundational experience in Angular and Node.js.

EDUCATION

Master of Computer Applications (MCA) — Savitribai Phule Pune University, 2015 – 2018

Bachelor of Computer Applications (BCA) — Krantiguru Shyamji Krishna Verma University, 2012 – 2015
