DIPAK SUMESARA

SENIOR BACKEND ENGINEER | NODE.JS • TYPESCRIPT • AWS • MICROSERVICES

Ahmedabad, India | +91-9662184977 | dipakbsumesara@gmail.com

linkedin.com/in/dipakbsumesara | github.com/dipak-sumesara | dipak-sumesara.github.io

SUMMARY

Senior Backend Engineer with 8+ years in Node.js and TypeScript. Led backend development for SwagUp's multi-tenant B2B marketplace, cutting API response times from about 4 seconds to 300–500 ms. Built event-driven integrations, payment and subscription flows, and an LLM tool-calling agent for shipping-box recommendations. Earlier built real-time features for a fantasy sports platform supporting 100K+ concurrent users, and backend services for Singapore's citizen health app.

TECHNICAL SKILLS

Backend: Node.js, TypeScript, JavaScript, Express.js, NestJS

APIs & security: REST, GraphQL, Swagger/OpenAPI, webhooks, WebSockets, SSE, JWT, OAuth, RBAC

Data: MongoDB, PostgreSQL, MySQL, Redis, Elasticsearch; schema design, indexing, query optimization

Architecture: Multi-tenant design, microservices, event-driven design, CQRS, idempotency, retries, dead-letter queues

Commerce: Razorpay, CCAvenue, payment webhooks, subscriptions, wallet

Cloud & operations: AWS (Lambda, API Gateway, SNS, SQS, S3, CloudFront, CloudWatch), Docker, Kubernetes, GitHub Actions, Sentry, Jest, Vitest

AI: LLM APIs (Claude, OpenAI, Ollama), tool calling, RAG, embeddings; GitHub Copilot, Cursor, Claude Code

PROFESSIONAL EXPERIENCE

SwagUp | Mar 2023 – Apr 2026

Lead Engineer | *Remote* | *via Extendime*

Aloha is SwagUp's multi-tenant B2B marketplace serving thousands of vendors and about 20K active products (up to 40K stored). Joined as a full-stack developer, then took backend ownership and worked directly with the founder.

- Cut API response times from about 4 seconds to 300–500 ms with Redis caching, query optimization and indexing, without caching price or stock data.
- Built the product-update pipeline: SNS fans out to SQS queues for Salesforce synchronization (5K+ messages a day) and Elasticsearch indexing, with idempotent consumers, retries and dead-letter queues. A scheduled job reconciles Elasticsearch with MongoDB.
- Built an LLM tool-calling agent behind the box-recommendation feature, replacing manual box picking for B2B orders. The agent calls Node.js tools for order items, product dimensions and box sizes, then returns a shortlist with a rationale.
- Split the platform into domain microservices (vendor, distributor, admin) on AWS Lambda behind API Gateway, with a central identity service (JWT, API keys, Google OAuth, role-based access).
- Designed tenant-specific workflows: vendors manage only their own products; each distributor has a separate catalog, collections, preset packs, storefront and order management over a shared product pool.
- Built scheduled batch migrations with Node.js worker threads, processing up to 50K records per run. Chunked writes limited database load, and idempotent upserts made reruns safe.
- Built a webhook-subscription API: external systems register callback URLs and authentication, and a Lambda delivers updates with retries and per-subscriber failure handling.
- Applied CQRS-style read/write separation: MongoDB primary for writes, secondaries and Elasticsearch for reads, accepting eventual consistency on reads. Used connection pooling and replication for availability.
- Designed schemas and versioned APIs documented in Swagger. Used PostgreSQL for subscription-based authorization, with transactions and an admin audit trail, and Redis for sessions and idempotency keys.
- Worked on payment, subscription and wallet flows: gateway integrations, queue-based payment-status tracking, idempotent webhooks, plan entitlements and transactional wallet updates.
- Supported production operations through Sentry, CloudWatch and Slack alerts, incident triage, hotfixes, rollbacks and root-cause analysis. Worked with DevOps on CI/CD and Docker/Kubernetes deployments, and ran releases and data migrations with rollback plans.

- Led system design with US product and engineering teams through RFC-style Confluence docs, set Jest and code-review standards, and mentored teammates. Migrated Aloha's JavaScript codebase to TypeScript with the team.

CoffeeBeans Consulting | Jun 2021 – Mar 2023
Software Engineer / Backend Lead | *Remote*

- Built Node.js backend services for Healthy 365, Singapore's citizen health app, as part of a 10-person team. Worked with a 90% minimum unit-test coverage gate, ESLint, pair programming, QA and staged Dev/QA/UAT/Production releases.
- Owned backend architecture and led a 3-engineer team for Salam Kisan, an agricultural supply-chain platform on Strapi CMS: REST APIs, Open edX integration and automated data-sync workflows.

Yudiz Solutions | May 2020 – May 2021
Software Engineer | *Ahmedabad, India*

- Built real-time backend features for 11Wickets, a fantasy sports platform supporting 100K+ concurrent users at peak: WebSockets for live scores and chat, Redis caching and leaderboards, PostgreSQL tuning, and wallet and contest-entry payment flows. Mentored junior developers.

Biztech Consulting & Solutions | Jan 2019 – Mar 2020
Software Engineer | *Ahmedabad, India*

- Proposed and led the modular Angular rewrite of BrushYourIdeas v2.0, adopted by the founding team. Packaged features as Professional, Ultimate or Custom module plans.

Angular Minds | Dec 2017 – Sep 2018
Software Engineer (Intern to Full-Time) | *Pune, India*

- Built Numnu, a food-event discovery app using NestJS, MongoDB and Angular/Ionic, with proximity and date-range search, used at the Royal Manitoba Winter Fair.

PROJECTS

AI Integration Discovery Agent | Sep 2026 | github.com/dipak-sumesara/ai-integration-discovery-agent
Proof of concept for an integration service: reads client API docs, probes a mock API through tool calls and produces a Zod-validated connector spec. Framework-free agent loop with switchable Claude/Ollama providers, mocked tests and SSRF protection.

AI Commerce Assistant | Sep 2026 | github.com/dipak-sumesara/ai-commerce-assistant
Turns natural-language product searches into Zod-validated filters using Ollama and deterministic TypeScript, with a guardrail for unrelated queries. Includes a small RAG pipeline using Markdown chunks, embeddings and cosine similarity.

EDUCATION

Master of Computer Applications (MCA) | Savitribai Phule Pune University, 2018
Bachelor of Computer Applications (BCA) | Krantiguru Shyamji Krishna Verma Kachchh University, 2015
